CONCLUSIVE EVIDENCE

By Mark Nutter

EXERCISE DETRIMENTAL TO YOUR HEALTH

A recent study has refuted previous claims that aerobic exercise promotes health. This study, performed over a three-day period by Dr. H. J. Chattergee and Dr. V. K. Chandra, both of the University of Michigan, proves conclusively that physical activity leads to disaster.

On Day One, the subjects of the study (Ed Huber of Frankfort, Illinois) were required to jog one mile. After fifty yards, the subjects (Ed) stumbled and fell headfirst onto the test track, receiving a minor concussion.

On Day Two, the subjects (Ed again) returned, and a heated argument with Drs. Chattergee and Chandra ensued. After being reminded he was being paid good money for the study, the subjects were shoved back onto the test track. This time, Ed stumbled after only six yards, receiving a second concussion on the other side of his head. The evidence was suggestive, but more testing was required.

On Day Three, Ed was hoisted out of his hospital bed by four orderlies and carried back to the track, where his legs were alternately lifted and planted in front of him by Drs. Chattergee and Chandra, in an attempt to simulate jogging. This time Ed traveled thirteen yards before collapsing onto the ground, screaming, "I hate science!"

Based on these results, aerobic exercise is not recommended; also not recommended is further study of aerobic exercise with Ed Huber.

EXCESSIVE ALCOHOL CONSUMPTION WILL NOT AFFECT YOUR ABILITY TO DRIVE A MOTOR VEHICLE

Drinking eight twelve-ounce beers before getting behind the wheel will have no effect on your reaction time, a recent study shows.

The subjects of the study (Ed Huber) consumed eight cans of beer during a twelve-minute period, afterward declaring, "Let's do some shots!" as foam dribbled down his chin. He was then escorted to his 2010 Chevy Malibu by Dr. S. P. Ramanujan of Stanford University, who reminded Ed that the study's budget covered only domestic beer, and not Jameson Irish Whiskey.

Ed denied feeling any effects from the alcohol, explaining that his attempt to French kiss Dr. Ramanujan was because the doctor had rich full lips and didn't make him jog.

Assurances that he would not hit or run over anything were given by the subject before starting his car, sideswiping a dumpster, and flattening a chokeberry bush.

At the termination of his journey, in the driveway of Ed's home, an inspection of the front bumper revealed bits of mud, moss, ceramic tile, pizza dough, barbed wire, and animal fur. Ed asserted that these bits were there before he got in the car.

"Lesh do shome shots," Ed repeated, as his head dropped forward onto the steering wheel.

A control group (Ed's younger brother, Dave Huber) was pulled over and arrested after only five beers. Ed regained consciousness, declared "Dave's a lightweight," then vomited on the passenger seat.

CAUSE OF AGING PINPOINTED IN RECENT STUDY

New data now confirms the single greatest factor contributing to the aging process is talking on the phone to Janice.

All subjects (Ed) were monitored for seven common signs of aging, then compared with the control group (Dave).

Beginning in the opening seconds of the phone conversation ("What is it now, Janice?") and continuing for five minutes ("How many times do we have to go over this?"), wrinkles appeared on the subject's face at the rate of one every 3.4 seconds. Age spots on the hands appeared at the eight-minute mark ("You know what you are? You're a vampire."). After nineteen minutes ("Take the flat screen TV. See if I care."), the subject ended the conversation at the sudden onset of incontinence.

Dave, although not on the phone with Janice, displayed identical symptoms. He explained, "I was all the way in the next room and I could still hear them."

STUDIES SHOW IT IS POSSIBLE TO BECOME SMARTER

You can easily boost your intelligence the way Ed Huber does by following the simple steps he described in a recent interview:

“Trust your instincts.”

“Don’t listen to scientists, even though they think they’re so smart.”

“Don’t agree to do anything scientists ask you to do, even if they offer you money, because in the end it’s more grief than it’s worth.”

“Don’t read books, especially the ones written by know-it-all scientists.”

“It’s best not to read any books at all written by anybody, scientists or otherwise.”

“If someone gives you a book as a gift, say, ‘No thanks, I’m already smart.’”

“If you have a relative who’s a scientist (I don’t but maybe you do), don’t invite them to Thanksgiving, because they will dominate dinner with their know-it-all science talk.”

“Don’t try to kiss scientists, because they’ll only break your heart.”

“Tell Dr. C. V. Rajneesh and Dr. S. P. Ramanujan to stop looking at me with those know-it-all faces and writing stuff in their notebooks.”

STUDY SHOWS THAT STUDIES ARE UNRELIABLE

A recent scientific study proves that scientific studies prove nothing, especially when the subject is Ed Huber. This study of studies was conducted by Dave Huber, who revealed that Ed always had a real bad attitude toward scientists ever since he was a kid. Dave Huber proposed repeating the studies with himself as the subject, for more money. Dave insisted the results obtained would be reliable, and would also be a way to get back at Ed for all the swirlies he gave Dave in their toilet bowl back at the house.
